### ■Abstract

There are many people who concern about asymmetric legs such as thickness difference.

Those of many women feel uncomfortable wearing skirts and get stress from it.

There are many cases that cause asymmetric legs: congenital, life habits, poliomyelitis sequale, car accidents, other accidents, gibbson legs and muscle rupture etc.

The cases of asymmetric legs are asymmetric thigh or calf and both of thigh and calf are asymmetry.

I'd like to present improved cases of asymmetric legs through fat transplantation, liposuction, calf muscle reduction, foot orthotics.
